

# Greedy Algorithm

- \* smallest / Largest  $\rightarrow$  optimal solution
- \* Best pick gives optimal solution ✓
- \* Local optimal = Global optimal ✓

Example: 1. Huffman  
2. Fractional Knapsack  
3. MST (Kruskall)

\* kruskall

| $w$ | $(u,v)$ |
|-----|---------|
| 1   | (1,2)   |
| ... | ...     |
| ... | ...     |
| ... | ...     |

\* Fractional Knapsack

|     | Weight (kg) | Value (TK) | Value/Weight (TK/kg) |
|-----|-------------|------------|----------------------|
| চাম | 50 kg       | 2500 TK    | 50 TK/kg             |
| ডাল | 20 kg       | 4000 TK    | 200 TK/kg ✓          |

\* 0/1 Knapsack

চাম

ডাল

চিনি

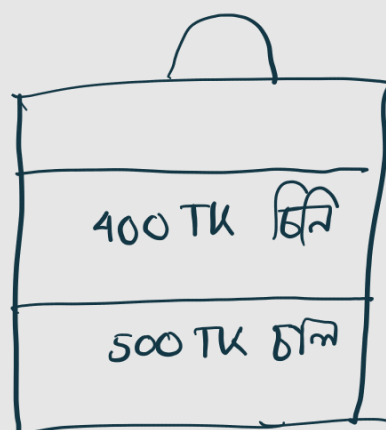

12 kg

Ans:

✗

or

✓

900 TK

Greedy algorithm won't give optimal sol<sup>n</sup>.

# Huffman Coding

Encoding algorithm

He llo  $\xrightarrow{\text{Encode}}$  101 . . . . .  $\xrightarrow{\text{Decode}}$  He llo  
ASCII

\* He llo  $\rightarrow 6 \times 8 = 48$  bit

\* Frequency high  $\rightarrow$  Codeword ছোট করে দেয়

Eyes are happy and hello

e  $\rightarrow 3$  11100101  $\rightarrow 10$   $\swarrow$   
l  $\rightarrow 2$  10110110  $\rightarrow 1011$   $\nearrow$

\* Is huffman coding greedy and does it give optimal solution?

\* Same frequency at the end or random position  
of priority Queue? which is more optimal?

☐ Eerie eyes seen near lake.

(a) Construct the Huffman Tree ✓

(b) Show codeword for each character ✓

(c) Show encoded message

(d) Total number of bits ✓

(e) Decode 1010001101111011110 ✓

✓ (f) Show that higher frequencies always get shorter keywords.

✓ (g) If you want to send 'BRACU' with 8 bit encoding scheme how many extra bit would you need?

\* Full stop, comma miss करा याद ना

(g)

BRACU  $\rightarrow$  8 bit

=  $5 \times 8 = 40$

=

Extra =  $40 - \text{[ ]} = \text{[ ]}$

# Huffman + Knapsack

4

You are designing a data compression and transmission system for a sensor network that monitors environmental conditions. Each type of sensor reading has a frequency of occurrence and an impact factor indicating its importance for critical decision-making.

Your goals are to compress the data efficiently for transmission using a variable-length encoding system and maximize the total impact factor transmitted within the system's data capacity.

Sensor Data Table:

| Sensor Reading | Frequency of occurrence | Impact Factor |
|----------------|-------------------------|---------------|
| Temperature    | 45                      | 10            |
| Humidity       | 13                      | 6             |
| Pressure       | 12                      | 8             |
| Light          | 16                      | 7             |
| CO2            | 9                       | 5             |
| Wind Speed     | 5                       | 4             |
| Rainfall       | 7                       | 6             |
| UV Index       | 3                       | 3             |

$$\frac{10}{45}$$

a.  
[CO1]

**Construct** a Huffman tree for these sensor readings based on their frequencies of occurrence. Then **assign** binary codes to each reading.

05

b.  
[CO1]

**Calculate** the total number of bits required for the transmission of all readings.

02

c.  
[CO1]

Suppose, the system can transmit only 15 units of data. **Each sensor reading generates 1 (one) unit of data per occurrence.** You can partially transmit the readings but its impact factor drops proportionally if you do so.

03

**Determine** which readings to transmit and with what frequency, to maximize the total impact factor within the 15-unit data limit. **Calculate** the maximum total impact factor.

Fractional

3

Wye is a CSE BracU Student. The pre-advising week is approaching, and he is trying to find the most suitable course combination for next semester. As per his previous academic results, his credit limit **has been set to 9**. Different courses have different credits. He came up with values for these courses by consulting with students who have already taken them. He wants to select the most valued courses. Courses, credits and values are provided below:

|        |        |        |        |        |        |
|--------|--------|--------|--------|--------|--------|
| Course | PHY112 | CSE330 | CSE331 | CSE370 | CSE499 |
| Credit | 1      | 2      | 3      | 4      | 5      |
| Value  | 9      | 7      | 15     | 12     | 16     |

CO1

a. Wye wants to try all possible combinations to find the best one. Help him by simulating a suitable dynamic programming approach. **Show** your work in detail, then **write** down the selected courses.

04

CO1

b. Zed, a friend of Wye, adopted a slightly different approach and considered the courses based on their per-credit value. **Determine** whether Zed could select more valued courses than Wye.

02

CO1

Note that, selecting a course still means taking the whole with full credits. ✓  
c. If Zed is successful, he will send a message **Successful**; otherwise, **Unsuccessful**. Instead of fixed-length coding, he is willing to send the message using Huffman Coding. **Show** simulation of Huffman coding to encode his message.
